How this was made

- **Extract:** Python reads Spotify's extended streaming history export.
- **Transform:** songs only, Austin time, duplicates and overnight loops removed, one song under many IDs merged.
- **Load:** a star schema in PostgreSQL, one fact table of plays and five dimensions.
- **Ask:** SQL views with CTEs and window functions, served by FastAPI.

What I left out on purpose

- IP address, country and device: dropped.
- Private sessions: excluded.
- Raw export files: never on GitHub.
- A play counts at 30 seconds, Spotify's own threshold.
